

Curriculum Plans: Year 10 (Chemistry)

	Topic	Knowledge: By the end of the unit students will know:	Skills: What skills will students have developed by the end of this unit?	Key terms: What new key terms and vocabulary will be learnt in this unit?	Summative Assessment: How will pupils be assessed in this unit?
Michaelmas 1	Bonding, Structure and Properties of Matter	<p>Different types of chemical bonding</p> <p>Ionic bonding and properties of ionic compounds</p> <p>Covalent bonding and properties of covalent molecules</p> <p>Metallic Bonding and properties of metal</p> <p>Particle model for states of matter and state symbols</p>	<p>Draw dot-cross diagrams to represent ionic and covalent bonding</p> <p>Explain how properties such as melting point, electrical conductivity, and hardness depend on structure and bonding</p> <p>Explain different properties of solids, liquids, and gases using the particle model</p>	<p>Ion: a positive or negative charged particle formed when an atom loses or gains electrons</p> <p>Electrostatic attraction: attraction between positively and negatively charged particles</p> <p>Ionic Bond: electrostatic force of attraction between positively and negatively charged ions</p> <p>Covalent Bond: the strong attraction between two non-metal atoms that share one or more pairs of electrons</p> <p>Delocalised Electrons: electrons from an element's outer shell that is free to move through a structure</p> <p>Metallic bond: strong attraction between the nucleus of a metal atoms and delocalised electrons occurring in metal elements and alloys</p> <p>Molecule: particle made from atoms, joined together by covalent bonds</p>	

Curriculum Plans: Year 10 (Chemistry)

				<p>Intermolecular forces : the attraction between the individual molecules in a covalently bonded substance</p> <p>Ionic lattice : a giant 3D structure of alternating positive and negative ions, held together by strong electrostatic attraction</p>	
Michaelmas 2	<p>Bonding, Structure and Properties of Matter Continued</p> <p>Chemical Changes</p>	<p>Properties of polymers Examples and properties of giant covalent structures Structure and properties of diamond and graphite How alloying affects metals Structures and uses of fullerenes, nanotubes, (nanoparticles), and graphene</p> <p>Reactions of metals with oxygen(air), water and acids Reactivity of metals How extraction of metals depends on reactivity Definitions of Oxidation and Reduction Neutralisation reactions of acids</p>	<p>Explain how properties such as melting point, electrical conductivity, and hardness depend on structure and bonding Ability to recognise and work with numbers in standard form</p> <p>Write word, balanced symbol, and half-equations for reactions Predict when reactions will occur and identify the products of reaction Explain choice of extraction method for</p>	<p>Polymer: a very large molecules made up of many repeating units, with atoms linked by strong covalent bonds</p> <p>Giant Covalent Structure: covalently bonded structure where many atoms are joined together by many strong covalent bonds e.g. diamond or silicon dioxide</p> <p>Fullerene: a form of the element carbon that can exist as cage-like or tubular structures based on hexagonal rings of carbon atoms</p> <p>Diamond: a form of the element carbon where each</p>	Written test using past exam questions, including those from previous topics

Curriculum Plans: Year 10 (Chemistry)

		How to prepare a pure salt sample from an acid	different metals using the reactivity series Identify reduction and oxidation Safely heating solutions using a water bath	carbon atom is covalently bonded to 4 others Graphite: a form of the element carbon where each carbon atom is covalently bonded to 3 others Graphene: a form of the element carbon where each atom is covalently bonded to 3 others AND is only one atom thick Reactivity series: An arrangement of metals in order of reactivity Displacement reaction: Reaction where a more reactive element takes the place of a less reactive element in a compound Oxidation: A reaction in which a substance loses electrons (gains oxygen) Reduction: Reaction in which a substance gains electrons (loses oxygen) Ore: A rock from which a metal can be extracted for profit Electrolysis: Decomposition of ionic compounds using electricity	
--	--	--	---	--	--

Curriculum Plans: Year 10 (Chemistry)

Lent 1	Chemical Changes ctd	<p>Definitions of Acid and Alkali</p> <p>How indicators and pH can be used to identify acids and alkalis</p> <p>Differences between strong and weak acids</p> <p>Electrolysis of molten compounds and aqueous solutions</p> <p>Representing redox reactions using half-equations (ion-electron equations)</p>	<p>Classify solutions as acidic, alkaline or neutral using litmus, UI, or pH</p> <p>Predict effect of changes such as dilution on pH</p> <p>Predict and explain the products of electrolysis, at each electrode, of molten compounds and aqueous solutions</p> <p>Identify which of 2 unknown solutions is a strong/weak acid by comparing reactions and properties.</p> <p>Explain why weak acids have higher pH, react more slowly, and conduct less well than strong acids of the same concentration</p>	<p>Acid: Solution with a pH less than 7; produces H^+ ions in water</p> <p>Alkali: Solution with a pH more than 7; produces OH^- ions in water</p> <p>Aqueous: Dissolved in water</p> <p>Strong acid: Acid in which all the molecules break into ions in water</p> <p>Weak acid: Acid in which only a small fraction of the molecules break into ions in water</p> <p>Dilute: A solution in which there is a small amount of solute dissolved</p> <p>Concentrated: A solution in which there is a lot of solute dissolved</p> <p>Neutralisation: A reaction that uses up some or all of the H^+ ions from an acid</p> <p>Electrolyte: A liquid that conducts electricity</p> <p>Discharge: Gain or lose electrons to become electrically neutral</p> <p>Exothermic reaction: Reaction where thermal energy is transferred from the chemicals to the surroundings and so the temperature increases</p>	<p>Written test using past exam questions, including those from previous topics</p>
	Energy Changes	<p>Exothermic and endothermic reactions</p> <p>Energy diagrams</p> <p>Measuring energy changes</p> <p>Calculating energy changes</p> <p>How chemical reactions can be used to generate electricity</p> <p>Factors affecting voltage of a cell</p> <p>Fuel cells</p>	<p>Identify exothermic and endothermic reactions</p> <p>Draw, interpret and label energy diagrams</p> <p>Use bond energy values to calculate energy changes for reactions</p> <p>Explain why reactions are exothermic or endothermic referring to the bonds broken and formed</p> <p>Evaluate the use of different cells/batteries</p>		<p>Written test using past exam questions, including those from previous topics</p>

Curriculum Plans: Year 10 (Chemistry)

				<p>Endothermic reaction: Reaction where thermal energy is transferred from the surroundings to the chemicals and so the temperature decreases</p> <p>Activation energy: The minimum energy particles must have to react – measured on an energy diagram from the level of the reactants to the peak of the line</p> <p>Reaction Profile: A diagram that shows how the energy changes during a chemical reaction from reactants to products</p> <p>Energy Change: Always measured on the energy diagram from the level of the reactants to the level of the products</p>	
Lent 2	Quantitative Chemistry	<p>Conservation of Mass What a mole is Avagadro's number How RFM is calculated How to calculate moles from mass How to interpret ratios in chemical equations How to calculate reacting masses</p>	<p>Explain apparent mass losses in chemical reactions</p> <p>Define relative atomic mass</p> <p>Calculate relative atomic mass from relative</p>	<p>Avogadro constant: the number of atoms, molecules, or ions in a mole of any substance (i.e., 6.02×10^{23} per mol)</p> <p>Mole: the amount of substance in the relative atomic or formula mass of a substance in</p>	<p>Written test using past exam questions, including those from previous topics. This may be completed at the start of Y11.</p>

Curriculum Plans: Year 10 (Chemistry)

		<p>Limiting Reactants</p>	<p>abundance and mass numbers of isotopes</p> <p>Calculate relative abundance from relative atomic mass</p> <p>Work out relative formula masses</p> <p>Define the mole</p> <p>Perform calculations using Avagadro's number (standard form)</p> <p>Use mass and RFM to calculate moles</p> <p>Use moles and RFM to calculate mass</p> <p>Convert masses in kg, tonnes, mg to grams.</p> <p>Use mole ratios from chemical equations</p> <p>Calculate reacting masses</p> <p>Identify limiting reactants</p>	<p>gram The symbol for the unit mole is mol</p> <p>Concentration:the amount of a substance dissolved in a given volume of liquid</p> <p>Limiting reactant :the reactant in a chemical reaction that when used up causes the reaction to stop</p> <p>Relative formula mass RFM :the total of the relative atomic masses, added up in the ratio shown in the chemical formula, of a substance</p> <p>Relative atomic mass A_r: the average mass of the atoms of an element compared with carbon-12 (which is given a mass of exactly 12). (Found on the periodic table)</p> <p>Thermal decomposition: Reaction where high temperature causes a substance to break down into simpler substances.</p> <p>Excess: When the amount of a reactant is greater than the amount that can react.</p> <p>Limiting reactant: The reactant in a reaction that determines the amount of products formed. Any other reagents are all in excess and will not react.</p>	<p>Appropriate quantitative chemistry questions will also be assessed in the EoY exam.</p>
--	--	----------------------------------	---	---	--

Curriculum Plans: Year 10 (Chemistry)

Trinity 1	Quantitative Chemistry ctd	Concentration How to calculate moles in solutions Percentage Yield Percentage Atom Economy How to carry out a titration Titration calculations Molar volume of a gas at RTP	<p>Calculate concentrations in moles per litre and grams per litre</p> <p>Calculate moles in solution using $n = cv$</p> <p>Safely and accurately use a burette (and volumetric pipette)</p> <p>Carry out titration calculations</p> <p>Calculate percentage yield</p> <p>Explain why percentage yields obtained are <100%</p> <p>Calculate percentage atom economy</p> <p>Explain how to improve atom economy</p> <p>Calculate moles of gas in a given volume</p>	<p>Concentration: the amount of a substance dissolved in a given volume of liquid</p> <p>Titration: A process used to accurately calculate the volume of one substance needed to fully react with another.</p> <p>Titre: The volume added from the burette in a titration</p> <p>Burette: Used to accurately measure variable volumes of liquids</p> <p>Pipette: Used to measure a set volume of a liquid</p> <p>Indicator: Changes colour with one drop of reactant when the reaction is at its endpoint</p> <p>End point: The point at which an acid has exactly neutralised and alkali and NEITHER is in excess.</p> <p>Molar volume: The volume that 1 mole of any gas occupies at room temperature and pressure = 24dm³</p>	
Trinity 2	Rate of Reaction and	How to measure and calculate rates of chemical reaction	Describe how to carry out simple practical investigations to	Rate of reaction: The speed at which a reaction takes place.	Written test using past exam questions, including those from previous topics. This

Curriculum Plans: Year 10 (Chemistry)

	<p>Equilibria (Completed in Y11)</p>	<p>How changes in surface area, concentration, pressure, and temperature affect rate of reaction Collision Theory What a catalyst is How catalysts work</p> <p><u>Probable Y11 Work</u> Reversible Reactions Equilibrium Effect of changing concentration, pressure, and temperature on equilibrium position Le Chatelier's principle Effect of a catalyst on equilibrium position</p>	<p>investigate rate of reaction. Safely carry out required practical investigating the effect of concentration on rate. Calculate average rate of reaction over a time period. Draw a tangent to a curve and use it to find the gradient (and therefore rate of reaction) at a point in time. Predict and explain the effect of changing surface area, concentration, pressure and temperature on rate of reaction and equilibrium yield.</p>	<p>This can be worked out in two ways:</p> <p>Mean rate of reaction = quantity of reactant used ÷ time</p> <p>Mean rate of reaction = quantity of product formed ÷ time</p> <p>Activation energy: The minimum energy particles must have to react</p> <p>Catalyst: A substance that speeds up a chemical reaction by lowering the activation energy</p> <p>Enzymes: Molecules that act as catalysts in biological systems</p> <p>Closed system: A system where no substances can get in or out</p> <p>Dynamic equilibrium: System where both the forward and reverse reactions are taking place simultaneously and at the same rate</p> <p>equilibrium: In chemical reactions, a situation where the forward and backward reactions happen at the same rate, and the concentrations</p>	<p>may be completed in Y11 when the topic has been completed.</p>
--	---	--	---	---	---

Curriculum Plans: Year 10 (Chemistry)

				<p>of the substances stay the same.</p> <p>equilibrium position: A measure of the relative concentrations of substances in an equilibrium, showing if there are more reactants or products at equilibrium.</p> <p>reversible reaction: A chemical reaction which can go both ways.</p> <p>Le Chatelier's Principle: "if a system is at equilibrium and a change is made to any of the conditions, then the system responds to counteract that change."</p> <p>Exothermic: Reaction in which energy is given out to the surroundings. The surroundings then have more energy than they started with so the temperature increases</p> <p>Endothermic: Reaction in which energy is taken in. The surroundings then have less energy so the temperature decreases</p>
