

Curriculum Plans: Year 11 (Combined Science - Chemistry)

	Topic	Knowledge: By the end of the unit students will know:	Skills: What skills will students have developed by the end of this unit?	Key terms: What new key terms and vocabulary will be learnt in this unit?	Summative Assessment: How will pupils be assessed in this unit?
Michaelmas 1	4.3 Quantitative Chemistry	<ul style="list-style-type: none"> - the law of conservation of mass and how to balance chemical symbol equations - how to calculate the relative formula mass from relative atomic mass and using both to calculate the moles of a substance - Using moles to calculate reacting masses and understanding the meaning of limiting and excess reagents - calculating concentration of solutions 	<ul style="list-style-type: none"> - Balancing chemical equations with respect to the conservation of mass. - Calculating formula masses, moles, and concentrations. - Applying quantitative analysis in practical and theoretical contexts to predict outcomes 	<p>Avogadro constant: <i>the number of atoms, molecules, or ions in a mole of any substance (i.e., 6.02×10^{23} per mol)</i></p> <p>Mole: <i>the amount of substance in the relative atomic or formula mass of a substance in gram The symbol for the unit mole is mol</i></p> <p>Concentration: <i>the amount of a substance dissolved in a given volume of liquid</i></p> <p>Limiting reactant : <i>the reactant in a chemical reaction that when used up causes the reaction to stop</i></p> <p>Relative formula mass RFM: <i>the total of the relative atomic masses, added up in the ratio shown in the chemical formula, of a substance</i></p> <p>Relative atomic mass A_r: <i>the average mass of the atoms of an element compared with carbon-12 (which is given a mass of exactly 12). (Found on the periodic table)</i></p> <p>Thermal decomposition: <i>Reaction where high temperature causes a substance to break down into simpler substances.</i></p> <p>Excess: <i>When the amount of a reactant is greater than the amount that can react.</i></p> <p>Limiting reactant: <i>The reactant in a reaction that determines the amount of products formed. Any other reagents are all in excess and will not react.</i></p>	End of Unit Test
Michaelmas 2	4.6 Rates of reaction	<ul style="list-style-type: none"> - how to measure and then use experimental data to calculate rate of reaction - Know the four factors that affect rates of reaction and be able to explain each using collision theory - Understand what crude oil is and how hydrocarbons 	<ul style="list-style-type: none"> - Balancing chemical equations related to cracking and combustion reactions. - Interpreting structural formulas for different organic molecules (alkanes, alkenes). 	<p>Rate of reaction: <i>The speed at which a reaction takes place. This can be worked out in two ways:</i> <i>Mean rate of reaction = quantity of reactant used ÷ time</i> <i>Mean rate of reaction = quantity of product formed ÷ time</i></p> <p>Activation energy: <i>The minimum energy particles must have to react</i></p> <p>Catalyst: <i>A substance that speeds up a chemical reaction by lowering the activation energy</i></p>	End of Unit Test
Lent 1	4.7 Organic Chemistry 4.8 Chemical Analysis				

Curriculum Plans: Year 11 (Combined Science - Chemistry)

		<p>can be extracted from it using fractional distillation</p> <ul style="list-style-type: none"> - know that alkanes are a type of hydrocarbon - know the products of combustion of alkanes and be able to balance the chemical equations - know what alkenes are and how they can be produced by cracking of alkanes - recognise pure substances, mixtures and formulations - know how to correctly use chromatography to separate coloured mixtures - know the tests for 4 gases 	<ul style="list-style-type: none"> - Predicting and explaining the outcomes of chemical reactions involving hydrocarbons. - Interpreting data from charts, graphs, and tables related to environmental chemistry. - Evaluating the environmental impact of products through life cycle assessments. - Comparing methods of metal extraction based on sustainability. 	<p>Enzymes: <i>Molecules that act as catalysts in biological systems</i></p> <p>Closed system: <i>A system where no substances can get in or out</i></p> <p>Dynamic equilibrium: <i>System where both the forward and reverse reactions are taking place simultaneously and at the same rate</i></p> <p>Hydrocarbon: <i>A molecule made of hydrogen and carbon atoms only</i></p> <p>Crude oil: <i>A mixture of a very large number of compounds.</i></p> <p>Mixture: <i>Two or more elements or compounds that are not chemically joined together.</i></p> <p>Alkanes: <i>A group of saturated hydrocarbons with the general formula C_nH_{2n+2}</i></p> <p>General formula: <i>This shows the number of atoms of each element in a substance which has 'n' carbon atoms.</i></p> <p>Saturated: <i>Molecule containing no double bonds.</i></p> <p>Unsaturated: <i>Molecule containing double bond(s).</i></p> <p>Fractional distillation: <i>A method of separating the different hydrocarbons in crude oil by using the fact that they have different boiling points.</i></p> <p>Boiling point: <i>The temperature at which the liquid boils and evaporates or the gas condenses.</i></p> <p>Volatility: <i>The tendency of a liquid to turn into a gas.</i></p> <p>Viscosity: <i>How easily a liquid flows.</i></p> <p>Flammability: <i>How easily a fuel burns.</i></p> <p>Complete Combustion: <i>When a hydrocarbon fuel is oxidised and energy is released. The carbon and hydrogen are oxidised, producing carbon dioxide and water.</i></p> <p>Cracking: <i>The process of using heat to turn large hydrocarbons into smaller, more useful molecules.</i></p> <p>Alkenes: <i>A group of unsaturated hydrocarbons, with the general formula C_nH_{2n}</i></p>	
--	--	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	--

Curriculum Plans: Year __11__ (Combined Science - Chemistry)

				<p>Unsaturated: When hydrocarbons like alkenes have a double bond and so have the potential to bond with extra hydrogen atoms.</p> <p>Bromine water: Used to test for alkenes – turns from orange to colourless.</p> <p>Polymers: A long molecule made of lots of monomers joined together.</p> <p>Pure substance: A single element or compound not mixed with any other substance.</p> <p>Formulation: A mixture that has been designed as a useful product. Many formulations are complex mixtures in which each chemical has a particular purpose.</p> <p>Chromatography: A technique used to separate mixtures.</p> <p>Stationary phase: The material the sample travels on but which doesn't move itself e.g. paper</p> <p>Mobile phase: The solvent which moves the sample. The more soluble the sample is in the solvent, the further it moves.</p> <p>Solvent front: The maximum point on the chromatography paper that the mobile phase reaches – usually marked on afterwards using a pencil.</p> <p>Retention Factor: The ratio of how far a substance moves compared to the distance to the solvent front. For the same substance this number will always be the same.</p>	
Lent 2	4.6 Equilibria 4.10 Using Resources	<ul style="list-style-type: none"> - Identify Reversible reactions - know the conditions needed for an equilibrium to occur - explain how changing factors affects the position of a chemical Equilibrium 		<p>equilibrium: In chemical reactions, a situation where the forward and backward reactions happen at the same rate, and the concentrations of the substances stay the same.</p> <p>equilibrium position: A measure of the relative concentrations of substances in an equilibrium, showing if there are more reactants or products at equilibrium.</p> <p>reversible reaction: A chemical reaction which can go both ways.</p>	

Curriculum Plans: Year 11 (Combined Science - Chemistry)

		<p>- understand why alternative methods of metal extraction are necessary and know examples of alternative methods</p> <p>- be able to construct and evaluate life cycle assessments</p> <p>- know the reasons for reducing the use of the Earths resources</p>		<p>Le Chatelier's Principle: <i>"if a system is at equilibrium and a change is made to any of the conditions, then the system responds to counteract that change."</i></p> <p>Exothermic: <i>Reaction in which energy is given out to the surroundings. The surroundings then have more energy than they started with so the temperature increases</i></p> <p>Endothermic: <i>Reaction in which energy is taken in. The surroundings then have less energy so the temperature decreases</i></p> <p>Sustainable development: <i>Using resources to meet the needs of people today without preventing people in the future from meeting theirs.</i></p> <p>Life cycle assessment: <i>An examination of the impact of a product on the environment throughout its life.</i></p> <p>Value judgement: <i>An assessment of a situation that may be subjective, based on a persons opinion and / or values.</i></p> <p>Ore: <i>A rock from which a metal can be extracted for profit.</i></p> <p>Phytomining: <i>The use of plants to absorb metal compounds from soil as part of metal extraction.</i></p> <p>Bioleaching: <i>The use of dilute acid to produce soluble metal compounds from insoluble metal compounds.</i></p> <p>Leachate: <i>A solution produced by leaching or bioleaching.</i></p>
